

# HOW the EYES Absorb Dangerous Lighting Weaponry

Burnt Retinas Become Cyanide

TO THE BEST OF MY KNOWLEDGE:

LOOK  
EYE  
DAMAGE

Rainbows go thru the optic nerve to the hypothalamus where it turns an image rightside up.

The artificial blue-rich L.E.D. oversteps our visible rainbow into a major flicker burning the optic nerve, the SCN (light/dark timeclock), the pituitary gland (dream, telepathy, intuition), and pineal gland (sleep). This burnt ATP (adenosine triphosphate) retinal enzyme turns into a form of cyanide when burnt.
