Final Preliminary Radio Frequency Scan Report

Date: November 5, 2025

Location: Reno, Nevada

Subject: Preliminary Radio Frequency Analysis for Jean Baptiste

Introduction

This document presents the findings from a preliminary radio frequency (RF) assessment conducted on November 5, 2025, in Reno, Nevada. The objective of this assessment was to detect localized RF emissions in proximity to Jean Baptiste using specialized RF detection instrumentation. This assessment is purely investigative in nature and does not constitute a medical evaluation, diagnosis, or treatment.

Instrumentation and Methodology

The RF assessment utilized the following measurement equipment:

JM-20 Pro General Frequency Detector: This device provides adjustable attenuation to ensure that detected emissions originate from within a narrow spatial range (1–2 cm). This feature minimizes interference from ambient RF noise and improves signal source localization.

PFM3000 High Resolution Frequency Counter: Used to detect and quantify RF signals within an operational frequency range suitable for personal emission detection.

Spectrum Analyzer: Deployed to establish a baseline RF profile of the test environment and to differentiate between environmental RF emissions and those potentially associated with the test subject.

Background and Context

A growing number of individuals globally have reported concerns regarding the potential presence of non-consensual subdermal electronic devices, suggesting possible applications in unauthorized surveillance and experimentation. These concerns have gained national attention, as evidenced by the Department of Homeland Security's hearing on May 8, 2024,

which addressed Anomalous Health Incidents (AHI) occurring within the United States. While no definitive causality has been established, RF-related phenomena have been noted in various case reports.

The objective of this assessment was to conduct a localized RF emission scan focused near narrow anatomical regions to determine whether any anomalous RF signals could be detected.

Findings

Positive frequency activity was identified near the following anatomical reference points:

Anterior Aspect

1. Left temporomandibular joint region
2. Left superior shoulder region
3. Left hip region
4. Anterior base of neck region
5. Left apex region
6. Upper abdominal region midline
7. Right superior shoulder region
8. Right apex region
9. Right anterior quadricep region
10. Nasal dorsum region
11. Right axillary region

Posterior Aspect

12. Occipital lobe region
13. Base of neck region
14. Right scapular region

Final Preliminary Radio Frequency Scan Report

15. Left scapula region

16. Lower lumbar region

17. Left hamstring region

The identification of localized RF emissions near very specific focal points around the human body is highly unusual and is considered an anomalous finding warranting further examination. However, it is critical to note that these detections do not inherently confirm the presence of embedded electronic devices or foreign materials. Further analysis and corroborative methodologies are recommended for validation.

A video recording of this testing session is provided with this report.

Recommendations

To further investigate these findings, the following actions are advised:

Nonlinear Junction Detection (NLJD): To assess whether semiconductor junctions are present within the identified anatomical regions.

Imaging Studies: Suggesting further imaging studies, such as X-rays, high-resolution ultrasound, MRI, or computerized tomography, to investigate the source of emissions and identify a potential foreign body.

Controlled Environment Testing: Repeating the RF detection process in a shielded environment (such as a Faraday cage or anechoic chamber) to eliminate potential interference from external signal sources.

Disclaimer

This report is intended exclusively for informational and investigative purposes. The results presented herein do not constitute a medical diagnosis, treatment plan, or health-related evaluation. Any further inquiry into these findings should be conducted by professionals specializing in the relevant technical or medical fields.

Biography

Cosmic Clarity Connections LLC

Final Preliminary Radio Frequency Scan Report

My name is Jesse Beltran. I am the former President of the International Center Against the Abuse of Covert Technologies (ICAACT) and have been conducting preliminary RF testing since 2010. My professional background includes Network Computer Architecture, proprietary programming, and membership in the Mathematics Engineering Science Association (MESA) through an outreach program with the University of California, Davis. I have certifications in Technical Surveillance Counter Measures. I am also a retired professional firefighter and paramedic.

About Cosmic Clarity Connections LLC

Cosmic Clarity Connections LLC focuses on education and investigative testing related to current trends in space, science, and human consciousness. We collaborate with human rights organizations and other advocacy groups to provide evidence for ethical investigations into technological abuses.

Our services include:

Preliminary RF Scanning: Detection of anomalous RF emissions near the human body using specialized equipment. In the past 15 years we have been finding cases in which individuals who are having positive findings in a preliminary radio frequency test have had electronic biosensors/RFID chips surgically removed from their person.
