To Whom It Concerns,

My Credentials and degrees include the following:

- Vocational Education Credential, Multimedia, San Jose State University, California
- Multiple Subject Credential, K-12, San Diego State University, California
- M.A., Education, California State Polytechnic University, Pomona, California - Educational Technology
- B.A. Multiple Subject, San Diego State University, San Diego, California

For most of my life I have experienced overall good health and enjoyed an active lifestyle of running, biking, swimming, and hiking.

In January of 2010, a unidirectional Wi-Fi node with an anti-rouge device was placed in a room next to my classroom approximately 20 feet from my desk. During the winter and spring of 2010, I began feeling ill while in my classroom with headaches and nausea. During the summer, my energy was excellent and was in good health. Upon returning to my classroom in August 2010, my tinnitus developed along with memory challenges, headaches and severe pressure to my head. My tinnitus became unbearable, especially when seeking medical help in offices with Wi-Fi, or in restaurants and hotels with Wi-Fi, or when outdoors near cell towers.

In October of 2010, I began to have severe tinnitus, painful pressure in my ears, poor memory, high anxiety, and disruptive sleeping habits. My symptoms became worse each day especially within buildings and in urban environments. My only way to seek relief was at the negative ion rich environment of the ocean away from cell towers, Wi-Fi, and people with cell phones. In November 2010, due to an extreme penetration of pain in my head while in my classroom, and my sensitivity to sounds known as hyperacusis along with my other symptoms, I was unable to continue my teaching duties, and left my position as a high school Multimedia instructor. I currently live in a rural area without any electromagnetic frequencies. I have no cell phone, no Wi-Fi, no wireless devices in my home. I have microwave sickness and must live away from any man-made frequencies.

Current independent scientific cellular research, detached from industry influence, cannot prove that wireless devices which emit non-ionizing artificial modulated data carrying waves are completely safe and do not cause harm to living beings. The FDA has tried to prove it and cannot. I am addressing here a "safe and healthy" experience. I am not speaking of "safety limits" or FCC standards. The FCC government safety limits are based on twenty-year old science and confuse the matter. This is a complicated issue. Do not deploy 5G technology until ALL people can live with it comfortably. I will be more than happy to speak to you on this.

Sincerely,

Mary Maio
