

I am sending in my comments because my sister has EHS and cannot tolerate being around wireless. She gets headaches, loses sleep, and overall gets sick and weak whenever she is exposed, including around smart meters. I have seen this and been deeply concerned for years. There needs to be better health and safety testing and process. When she told me that no testing had been done, or standards been established for safe levels since 1996, I was appalled.

I have two young children in school, and they are exposed to wireless every day. At night, we turn off our routers and phones. But there is so much exposure from all directions- cell towers, smart meters, earbuds, smart tvs and more, all around us, piling up, features in cars, and **literally no one has been checking to see if these could have short or long term health effects**- and yet there are the canaries in the coal mines who are suffering, speaking out, the EHS and affected people, who say, stop, you need to study this, you need to do real science, and not just keep pushing money in the pockets of the telecoms.

Please, **think of all the babies sleeping every night exposed to this**- what might this do to them? I have met people who have had severe memory loss, like the firefighters in the studies and articles below, and confusion, and constant headaches, tremors, shakes and more, just from having a smart meter installed in their homes. I am seeing the comments coming in here, and they are not alone- there are thousands, if not millions of people affected. And for all those of us who do not feel it, how can we know what will happen in the future, and to our children? We can't know, the technology is new and keeps changing, and none of what we have now is consistent with studies from 1996. That's ridiculous. You need to make serious scientific testing mandatory and prerequisite for any new technology or rollouts of products or placements of towers, avoid schools and residential areas and homes, and focus on keeping our futures safe and healthy.

It is not alarmist when I see hundreds and thousands of people writing in, speaking out in public meetings over and over, about their health effects, many linking brain tumors to phone usage. It is not alarmist when thousands express concern, and want to talk about health, but **the industry has forbidden citizens and elected officials from speaking about health as it relates to wireless**. Really? If there is nothing to worry about and your studies from 1996 have assured you it is so safe, why are citizens and elected officials silenced and forbidden from discussing this? Why is this the very first time we are permitted to ask about this, to demand health and safety and proper testing and disclosure of all results? **Why has our country never considered what other countries are doing to protect children and residential areas and the most vulnerable?** In many of those other countries, they put people and health first, over profit. That is what you must do now.

Look at your kids, your family, your grandchildren if you have them, and think about their young bodies, their tissue and heads absorbing so much more of this exposure, that's not even considering screen addiction or social media. Separate from that, 24/7, they are exposed to something we cannot know is safe and has not been tested properly at all, and more keeps coming. Each of these kids may be affected differently, perhaps one may not be affected at all, perhaps another may develop sleep issues, headaches, memory loss, or have learning challenges. They may not ever know why. Perhaps they may develop complex health issues or mental and emotional that affect their development and their entire lives. **They deserve better.** We know for sure that wireless health issues are also often tied to those who also have Lyme disease or mold poisoning. Both of those are extremely common and becoming more common. Finally, doctors and health organizations are recognizing mold risks, and Lyme, and that these are serious conditions. And wireless sensitivity is almost always part of those too. What is going on here? We will need scientists, operating independently, to tell us and to help us protect our health and futures. Please take action on this serious issue right now.

NO ONE is measuring the amount of radiation kids are being exposed to day after day as they sit in their classrooms. The FCC guidelines were never intended to protect children (and they don't).

Here are some of the latest independent, peer-reviewed and published studies, reports and analysis documenting biological harm from exposure to non-thermal levels of RF radiation and electromagnetic fields. See also behavioral studies.

Animal studies from Yale University demonstrate that exposure to FCC-approved levels of wireless radiation during pregnancy can disrupt normal brain development.
