

I am very grateful to you to have spread out your good sense for social justice. I am a psycho-educator (this profession only exists in Québec) and I worked a long time in schools. I always read my scientific professional reviews and was pretty up to date because I like to read my abstracts before consolidating my opinion.

Since the middle of 2000, I began to feel dizzy at school, since the technology of information (TIC) began to be a popular way to communicate with other and learn.

The 2008 years brought much higher frequencies into the wireless technology industries in Québec. Then, I had to stop working, unable to stay focused on priorities and keep my sense of orientation (the funny part is that I was always sure about my "cardinal points"...I was in the Scout movement after all...)

I tried to work again in 2015 but the physical symptoms I felt (pain in my left ear, dizziness, headache, loss of orientation) were too bad and hazardous for my health. I had to lie down for a long time after a day of work in a high school where 1000 students were using smart phones, and where were installed routers infrastructures, wireless antennas and where Wi-Fry were in big expansion, advertised as social progress.

I am trying to stay calm and cool about it but to tell you the truth, I am mad about what is going on right now. I always learned and taught that teachers and students are supposed to have the best environmental conditions in order for them to have a good learning relationship. The freedom of thought is based upon confronting real observed facts and figures in authoritarian positions.

Students were able to expose big pharmaceutical firm's conflict of interest, GMO corporations and merging industries which were invading their territory. But otherwise, no teacher had the power (and maybe the health) to expose the invasion of territory by the wireless electromagnetic telecommunication industry.

Teachers in Québec are often sick along as the children.

We have the highest rate of infantile cancers in Canada, as long as the higher suicidal rate. We are exposed to very high energy voltage (Hydro-Québec has a private distribution industry (or industries) of power electricity since 1996 and its capacity of production has a national recognition which was funded by public since 1965 or so). The voltage produced here is distributed on very high electric tension field lines ("lignes à haute tension" going from 115 to 720 electroVolts). The amplitude of the magnetic field, (Amp) generated by these high voltage power tension lines, is now enhanced by the wireless industries, feeding upon this very high electric voltage field to carry the wireless distribution of data. The electromagnetic field created by these combinations of energetic factors is already too high. The spectrum of electricity and light, being rented by private and very wealthy corporations, is adding up to the already too high density of CEM in Québec.

The television marketers are selling Wi-Fi as a good way to get the wireless signal into every piece of our house, when plugged into every electrical outlet.

So, we have the power of producing high amplitude of magnetic field, distributed elsewhere on a long tension voltage and we are told to add up to this density of electromagnetic field with another 800milliwatts on every corner of our Quebec homes!!! (sponsored by Amazon, like other things). It is disgusting.

I have seen teachers sick. I have seen children sick. I am sick. My sister is sick. I cannot go to public spaces more than an hour. I am trying to be able to stand up and stay cool about this high exposure density of electromagnetic field. It is hard to stay cool when you feel burned out and gradually fried in.

In Canada, English people call the French-Canadians "frogs". When the frogs will be dead, from a too long exposure of smart "neuro-toxi-cities", the guardian of aquatic population will be extinct. I am scientifically and truly emotional about what is going on.

Marie-Claude Lefrançois
Rosemère

(This same town is trying to win the "smart city contest", sponsored by "smart grid corporations". They are putting smart meters everywhere they can to win this contest. Even aside the bike supports, the right of ways for children and parents, the light posts; every place that is closed to community transportation... I want to throw up. Give me an ecological bag...)
