

Hello,

First, please know I am not afflicted with the issue of Electrosensitivity. But, after several hidden tests with my wife, I had to confront my own doubts.

This IS a real issue. Whether or not it affects everyone, I do not know. But what I do know is that the label of 'handicaps' exists everywhere in our societal fabric. It can be as well defined as being paralyzed or as trivial as a 6'8" person having to duck to get through a doorway. I realize governments have to draw the line somewhere, but until now that line was only abstractly drawn with second hand smoke or radiation. Now we're presented with the greatest challenge of all; "pervasive impact". By its very nature wireless technology strives to be 'pervasive'. So, to tell these people on this planet who can actually feel the adverse affects, "suffer with it". That's just plain wrong. That's like not putting braille on elevator buttons, or having no ramps for wheel chair bound people. It's just plain wrong.

No one on this planet can 'logically' claim this is not an issue. We are ALL different. To say some people can not feel the pain of such technology is being blind to our own selfish desires. The mere cost to those who've tried to find a solution is ungodly. We lost our entire savings trying to find a cure along with the constant uprooting to find a safe haven for my wife. We're now living near the 'quiet zone' outside of Green Bank, WV. My wife has improved dramatically, but can still feel the adverse affects during brief encounters with it.

I find it very odd, we can put our faith in an industries' 'claim' EMI is not harmful, yet the ungodly amounts of money dumped into that same medical industry to cure cancer has returned little relative to the amounts consumed. Have you, or anyone you know, been diagnosed with having cancer? And, if so, has their doctor's emphatically confirmed the 'cause' of it. Quite succinctly, NO. Oh sure, we have 'ideas' on what causes it. But to have a doctor claim they 'know' the cause simply will not happen. So, why then must we adhere to the medical industries claim that the highly concentrated frequencies are not harmful?

Oh we know the 'marketing' dollars spent by a multi trillion dollar industry will do much to refute these claims, but just remember one thing: whether you wear glasses, have an hearing aid, are overweight, are short, have a disease (the list is endless); "we are all different". Please respect these adversely affected humans by, at the very least, providing 'safe havens' as a reprieve from the pain they feel.

Very sincerely,
Lowell M. Lannert
