SECOND PART of HHS SUBMISSION

This SECOND PART is a short description of how massively (criminally in my opinion, because industry knows RF is dangerous) underregulated RF/EMF proliferation has ruined my life. Worse, I have spent the last 20+ years trying to warn others. They tell me they have done "their research" and industry published, fraudulent reports have deceived them into believing RF wireless tech is perfectly safe. I lend/give meters, books, shielding fabrics/pouches, wired earphones, and internet links. Even the few who believe me, still use too much tech because modern life and jobs require it. I use wired internet, a wired VOIP phone at home, a 4G LTE flip phone (off except when in use) with wired earphone for EMERGENCIES like calling a tow truck when out, or to receive ID confirmation codes for online banking and payments from businesses that refuse to confirm by email.

PERSONAL EFFECTS: I do not leave my substantially shielded home without

1) having to wear hot, expensive, flimsy and only partially effective shielding clothing,
2) being so exhausted from the exposure that I must sleep for 2-6 hours to function again,
3) more harm to my already vaccine injured eyes from state mandated childhood polio shots.

>My out of home activities are restricted to paid employment, essential shopping early morning/late night when fewest customers are present, banking that cannot be done online, taking my car for repair or the like. I cannot ride in a vehicle where smart phones are present or in use, like a taxi, Uber or Lyft, a bus, train, airplane, ferry or cruise ship because the RF is off the charts. I own multiple professional grade RF meters, and signal strengths are often beyond what the meters can display, 2,500,000 microW/M2. The electric/magnetic fields inside an EV/hybrid that are so much higher than gas/diesel cars, cause pain and dizziness. I can't buy a new car because of the electric/magnetic fields from onboard electronics and RF emissions. At least the body of my old manual transmission car offers some protection from RF emissions from traffic when I drive alone. I restrict driving as much as possible to hours between midnight and 5 AM weekdays/7 AM weekends when traffic is lightest.

>I don't voluntarily go where smart phones or WiFi are active, like a concert, meeting, lecture, auditorium, theater, library or school. I don't even visit friends because even if they don't use wireless, the overflow from their neighbors hits me.

>While I still have enough incandescent light bulbs, most people/locations have switched to LED lights which cause me severe back pain after 15-60 minutes. When LEDs are off the pain appears later, but is NEVER present inside my own home. I discovered when trying to buy a new computer monitor for my totally wired system, that new screens are LED instead of the innocuous LCD, so I had to buy a used LCD monitor to avoid more eye damage to my already California mandated (1961 law) childhood polio vaccine injured eyes (1963).

>While my home was partly shielded from previous alterations, I had to put expensive shielding paint on my exterior stucco wall, and install a

$3,000. metal roofed patio cover to protect the back. My front yard is fried by the 5G antenna across the street and my yard consequently looks like hell. Car washing with aa rag and bucket is hard, because finding lower RF locations like big parking lots or public parks tend to aggravate authorities.

>Luckily, I was able to talk my local utility out of installing a purportedly "non broadcasting" digital meter on my home by presenting the results of a professional EMF survey demonstrating that it would put lots of dirty electricity onto my wiring.

>Now I learn that my DSL (carried on the POTS copper landline network) wired internet and VOIP phone will soon be disconnected because AT&T and all other service "providers" are greedily and successfully petitioning regulators to allow them to rip out copper landlines in favor of wireless and partly wireless communication. The ill effects of regulatory failure caused by industry capture of applicable regulating agencies continues to destroy people, animals like pollinating insects and birds, and plants in the environment.

I learned in the late 1990s that wireless tech was unsafe, so have used it very carefully. Therefore, I have not adapted to the extent ignorant/deceived people have. I can tell what causes pain, fatigue and disfunction so I avoid as much as possible. Duh.

TELECOM (should we call it TeleCON?) KNOWS WIRELESS IS UNSAFE as well, partly because insurers won't cover damage from it:
Brave search summary: "Electromagnetic/radio frequency radiation (EMF/RFR): A standard exclusion across the market. Illnesses or property damage from long-term non-ionizing radiation exposure (e.g., cell tower emissions) are excluded. US mobile operators have been unable to obtain coverage for RF-related bodily injury claims for over a decade."
https://ehtrust.org/electromagnetic-field-insurance-policy-exclusions/
statements attached because there is insufficient room here.

The other attachments were collected by another person, not me, and previously submitted to the FCC, which, or course, has ignored the,

I have known for decades about regulatory agency capture by the industries that government pretends to regulate.
I have known for decades that Pharma runs medical education, medical treatments and diagnostics, often to the detriment of society. I have consequently learned how to care for my own health. I hope someone reads this submission.
