

To Whom It May Concern:

At the age of four, my daughter began to exhibit extreme physical symptoms including debilitating migraine headaches, vomiting that would last for up to six hours, nausea, loss of muscle control and intermittent confusion. After much research and many doctors' visits, she was diagnosed by neurologists at Lurie Children's Hospital with light-triggered migraines. Any form of lighting that emits high levels of UVA/UVB radiation makes her incredibly ill. When not exposed to radiation in these forms, she is completely well and healthy.

After smart meters became installed in Illinois, she began to exhibit the same symptoms in the presence of homes with smart meters. The onset of symptoms was delayed but the duration of symptoms became much longer and the intensity of symptoms much more extreme. Her neurologist has been clear that avoiding any potential triggers, including fluorescent lighting, mercury vapor lighting, smart meters, wi-fi hot spots and extreme wireless technologies; is the best overall solution and the only preventative solution. My daughter is covered by a Federal 504 Plan in her school district. This assures that the environment in school is safe for her.

However, should 5G wireless technology become mandatory in our state, avoidance will be impossible. I wonder, at that time, how I will ever keep her healthy at home.

I ask that you consider these health issues before proceeding with any expansion of wireless technology in Illinois. And I respectfully ask that you research the health implications of 5G. To add a broader perspective to this argument, I refer you to the attached letter from Dr. Ron Powell, who is a uniquely qualified voice on this subject. His experience in wireless technologies both inside and outside of the government is impossible to ignore.

I look forward to your response.

Sincerely,

Lynn Dangel Costello
